

Instructions for retrieving a single meeting result record via the Builder Prime API

The app should submit a GET request to:

```
https://<builder-prime-subdomain>.builderprime.com/api/meeting-  
results/v1/<meetingResultId>
```

Replace `<builder-prime-subdomain>` with the specific subdomain specified by the customer.

The internal `meetingResultId` field must be specified in the request path in order to retrieve the record. If this value is not specified, it will attempt to retrieve a list of meeting results instead.

The request must include the secret key created in the Builder Prime app with `meetingresults.read` scope as the value for a header key of `x-api-key`.

```
{  
  "success": true,  
  "data": {  
    "id": 1001,  
    "name": "Sale",  
    "isSalesMeeting": true  
  }  
}
```

A sample response for a failed operation from the API will be a format such as:

```
{  
  "success": false,  
  "errors": [  
    {  
      "code": "API_UNAUTHORIZED",  
      "message": "Unauthorized request.",  
    }  
  ]  
}
```
